

Migration of ABINIT GitLab to gitlab.uliege.be

Xu He & ABINIT technical group

About `gitlab.uliege.be`

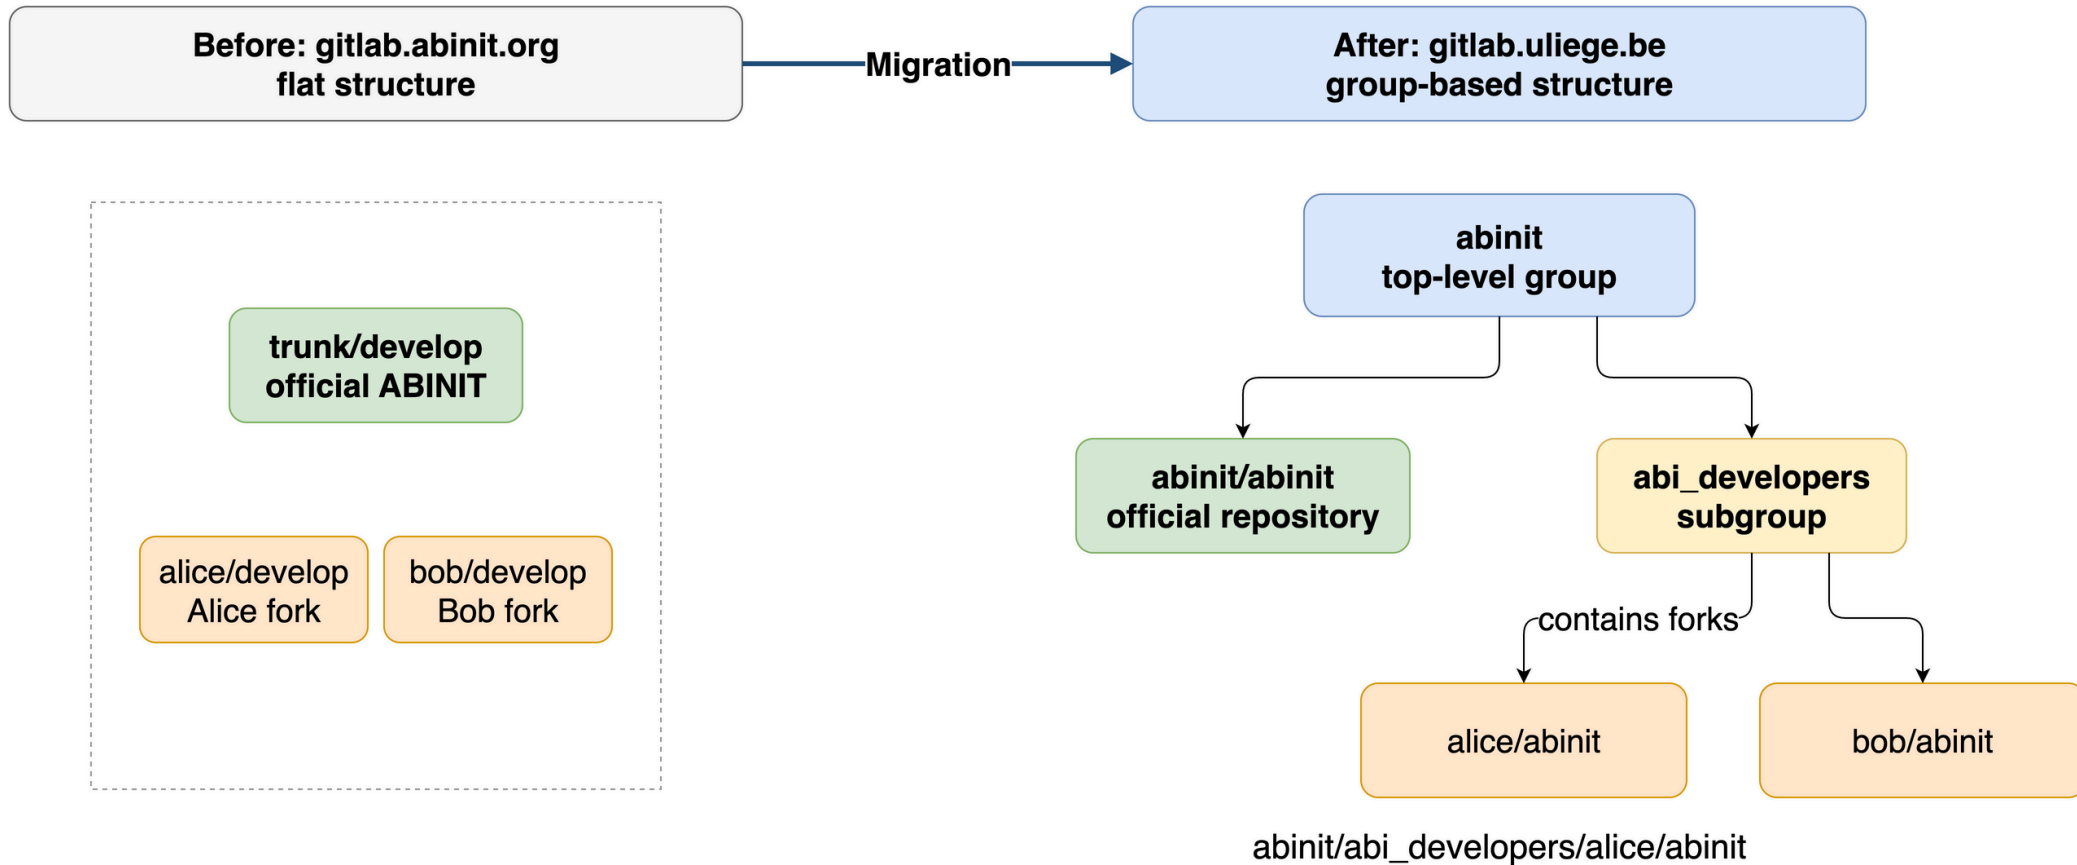

- `gitlab.uliege.be` is a ULiege-hosted GitLab Enterprise Edition platform restricted to the academic usage.
- ULiege IT (SEGI) provides some support in the context of AbiLogix, including infrastructure, maintenance, management, and data backup.
- Accessible to both ULiege members and others (through gitlab.com account and group based permission management)
- Enough hardware capacity to host usual ABINIT development.
- CI/CD support but with limited hardware resources.

What will be migrated

- **Git history** will be migrated but modified: large files are removed from history while useful history information is kept.
- **User accounts** are not migrated by default; users must register on `gitlab.uliege.be`.
- **Issues and merge requests** will be migrated.

User account names and discussion authors cannot be preserved automatically when those accounts do not exist on the new platform. These information will be patched into the text where possible.

Difference between two platforms

How to migrate: admin guideline

Brief procedure for admins:

1. Export the `gitlab.abinit.org` trunk .
2. Upload/import the project to `gitlab.uliege.be` .
3. Patch issue and merge-request information where account names/discussions cannot be mapped.
4. Configure subgroups and permissions.
5. Register users to the group and set up each user's Git repository/fork.
6. Configure the test farm integration.

The procedure has been tested and documented.

Integration with the test farm

- The new `abibuildbot` includes a GitLab API integration, currently wired to `gitlab.abinit.org`.
- A compatible API for `gitlab.uliege.be` has been implemented.
- After migration to the new test-farm infrastructure, the configuration will be switched to the new GitLab platform.

How to migrate: guideline for users

This section is for individual ABINIT users and developers.

You will need to:

- Register an account on `gitlab.uliege.be`.
- Send your account name to the admin group.
- admins will set up access and your repository.
- Configure your user profile and Git access.
- Migrate your local Git repository.
- Push changes or send merge requests on the new platform.

2. Accounts

Two ways to get access:

- ULiege email account
For ULiege members and the technical team: Xavier, Matteo, Marc, Fabien.
- GitLab.com account

gitlab.uliege.be

You can [explore public projects](#) without an account. You need to register to submit issues or to contribute code or documentation.

 GitLab.com

ULiège Login

3. How to configure local Git

Option 1: clone your new repository/fork:

```
git clone <your_git_repo>
```

Option 2: keep an existing local checkout and add the new remote:

```
git remote add <remote_name> <your_git_repo>
```

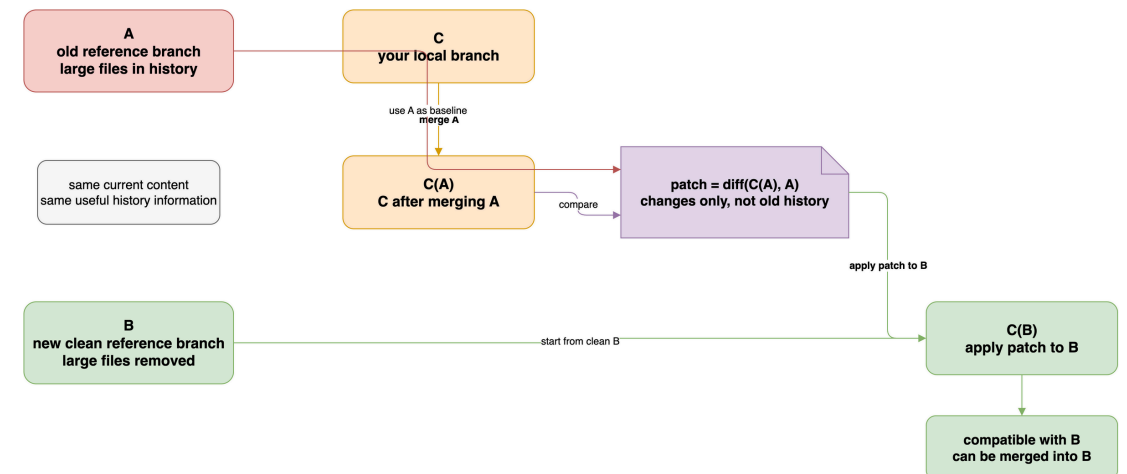

Then verify remotes before pushing:

```
git remote -v
```

4. What to do with existing developments

Two options:

- **Option A:** get your work merged into trunk before the actual migration.
- **Option B:** follow the clean-history procedure.

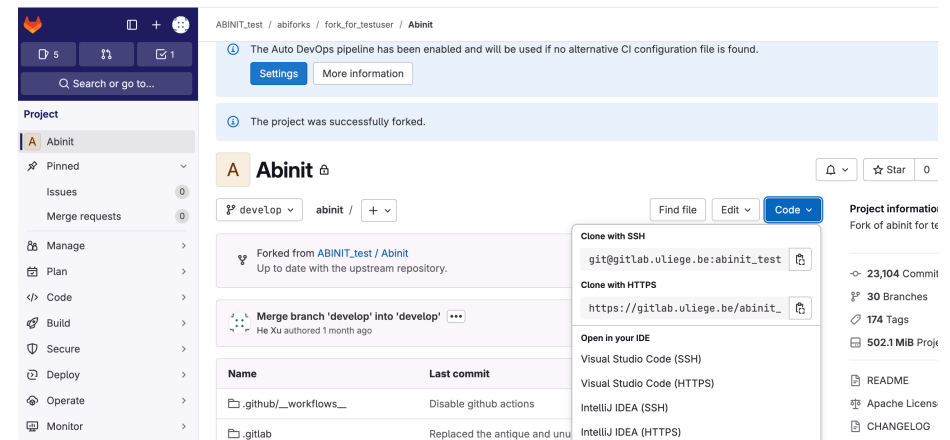

This may look complicated, but a script will be provided to do it automatically.

5. Usage of gitlab.uliege.be webpage

Useful pages to know:

- Project overview page.
- Repository and branch pages.
- Members / permissions page.
- Merge request page.

GitLab actions and pre-commit rules

The followings are checked.

- files larger than 11 MB.
- trailing white space
- Executable scripts without shebang.
- yaml file are syntax validated.
- missing final newline
- unresolved merge conflict markers
- CRLF line endings

Enforcement

- Rules will be enforced by GitLab actions for merge requests.
- If activated, `git commit` will check whether these rules are followed.
